

Climate change: And What You Can Do To Limit Your Effects

Climate change refers to the long term change in temperature and weather patterns. Though climate change has been studied by scientists for a long time. it didn't become widely known by the public till 1988. In our presentation it'll be covering steps that you can take to help in the fight for climate change.

Looking deeper into the topic of Climate change leads us to ways we can help to prevent the rising increase in CO2 emissions. We could reduce our consumption, start taking public transportation if available, if you can afford it, maybe even purchase an electric vehicle. Most importantly the biggest way in helping reduce CO2 emissions would be to speak up against it. Pressuring your politicians to put barriers up for the oil, gas, coal, and cement producers. Like Exxonmobil, Shell, and BP.

Back in 1988 climate change was viewed as a future threat. Now it is a present crisis. Temperatures have risen 1.2 celsius and are continuing to increase. If we do not try to help reduce our global CO2 emission now to slow down our rapidly changing temperatures it will lead to more frequent extreme weather, rapidly melting ice sheets, and accelerating sea-level rise.

Biography:

William Ojiako is a Computer science student at the University of Kansas, where he studies programming languages, algorithms, and computer manufacturing. For fun he likes to sleep.

Wilder Incontrera is a Business Marketing Major at the University of Kansas, where he studies business analytics and marketing strategies. For fun he likes to watch sports.

Noah Gabrielson is an African American Gender Studies Major at the University of Kansas, where he learns about Marsha P. Johnson. For fun he likes to watch My Little Pony.

Ian Epstein is a Japanese History Major at the University of Kansas, where he learns about Anime. In his free time Ian enjoys watching "If My Wife Becomes an Elementary School Student".
